

SORTY LEGAL

Sorty Privacy Policy

Last updated June 2026

The short version

Sorty does not collect telemetry, analytics, or personal data. Your files stay on your Mac. When you use a cloud AI provider, only file names and metadata are sent for analysis, never file contents unless you explicitly enable Deep Scan. Your Learnings profile is encrypted with AES-256 and protected by Touch ID or Face ID.

1. Overview

Sorty is a native macOS application published by the Sorty open-source project and licensed under the [GNU General Public License v3.0](#). This Privacy Policy explains how the App handles information when you use it.

Sorty runs entirely on your device, within the macOS App Sandbox, and is designed so the smallest amount of information necessary leaves your computer, only when you choose a cloud-based AI provider. We do not operate servers that process your files or personal data.

2. Data We Collect

We do not collect, transmit, or store telemetry, usage analytics, crash reports, or personal data. There is no Sorty account and no database of user information.

Organization history, settings, preferences, watched folders, exclusion rules, personas, and naming presets are handled locally on your device.

3. AI Providers & Your Files

Sorty is provider-agnostic. You choose which AI provider analyzes your files, and you can switch or disable providers at any time in Settings.

When using a cloud provider, file names and metadata are sent for analysis. File contents are not uploaded unless you explicitly enable Deep Scan, which uploads small content excerpts. All traffic occurs over HTTPS with TLS 1.2 or later. API keys are stored in the macOS Keychain.

For maximum privacy, use [Ollama](#) or [Apple Foundation Models](#) for on-device processing. When you use a third-party AI provider, review that provider's own policies, including [OpenAI Privacy](#) and [Anthropic Privacy](#).

4. Local Storage & Encryption

The Learnings Profile is stored with AES-256 encryption and protected by Touch ID or Face ID. API keys are stored in the macOS Keychain. Privacy Mode blurs sensitive handles until hover and hides API keys behind a manual reveal toggle. Privacy Path Masking redacts usernames from file paths shown in the UI and logs.

5. Network & Update Checks

The App checks for updates by fetching version data from the [GitHub Releases API](#) over HTTPS. Update checks run on app launch at most once per 24 hours or manually via the menu. No telemetry or analytics are included in these or any other requests. You can disable automatic update checks in Settings.

6. Sandboxing & Permissions

Sorty runs within the macOS App Sandbox with user-selected file access for folders you grant, network access for AI provider APIs and update checks, and no system-level access outside the sandbox. You can revoke folder access by removing a folder from the Watched list or in macOS System Settings.

7. Third-Party Services

Sorty integrates with [Sparkle](#) for updates, your chosen AI providers, and [GitHub](#) for releases and the update feed. Each third-party service is governed by its own policies. Releases are not code-signed with an Apple Developer certificate; you may verify integrity by [building from source](#) or checking release notes. See [SECURITY.md](#) for full details.

8. Children's Privacy

Sorty is a general-purpose developer and productivity tool and is not directed at children under 16. We do not knowingly collect personal data from anyone. The App collects no personal data regardless of age.

9. Your Rights & Controls

Because Sorty stores everything locally and collects nothing, you control your data. You can delete local data, reset settings, use on-device AI, disable Deep Scan, and disable update checks.

10. Changes to This Policy

We may update this Privacy Policy as Sorty evolves. Material changes will be reflected in the [Changelog](#) and via in-app notifications. The Last updated date indicates when this policy was last revised.

11. Contact

For privacy or security questions, use [GitHub private vulnerability reporting](#) or open a [GitHub Discussion](#) for general questions. For security reports specifically, see [SECURITY.md](#).
